# Release 2.30.x (09.02.2024) EN

Release Date: 09.02.2023

Release Components: GoCompliant Toolsuite

## New Features

- **1028, 1029 and others: Improvements in the dashboards**

  Some new functionalities have been developed in the dashboards, in particular the following new options should be emphasised:

  - Explanatory texts / footnotes can be entered in each dashboard tab (in the template)
  - Fields on the X-axis of dashboards can be filtered, e.g. only display measures for active reports, only list reports that have been closed in the last 6 months. Implemented via
  - new field "Filterable on dashboard" in the template.
  - Report closing date has been added as an analysable field (relevant for internal audit reports)

- **1030   Additional fields can be calculated automatically based on other data**

  In addition to default values, the customized additional fields can now also be assigned formulas that enable the automatic setting of content (e.g. a calculated % rate or a text based on other values). If required, the fields can also be assigned colors that adapt to the field content.

## Small Enhancements

- **1113   Issue due date can be restricted**

  In the action type, the due date of an issue can be restricted to a number of months from today when it is created. The end of the month is always checked.

- **1054   Search form can be selected directly**

  Minimisation of the number of button clicks when a search form is to be used.

- **1055   OE-Text_Key can now be entered via GUI as long as it is not yet set**

  Important option for all customers with SmartControls that are to be automatically distributed to OE. The key is relevant for automatic distribution and must be able to be set (previously had to be done by Support, can now be done independently by the customer).

- **1058   Incident can be linked to asset**

  Incidents can be linked to protection objects from the asset inventory.
